Professional Summary

Computer Science graduate and solo founder building production fintech systems end to end. Founded Sorae a bank statement intelligence platform that parses data from South Africa's 5 major banks to support lender affordability and underwriting decisions. I'm comfortable with owning full SDLC with the focus towards systems that solve real operational processes. I'm looking to bring that same ownership to a team.

Education

Bachelor of Science in Computer Science - Eduvos ***2023 – 2026***

Relevant Modules: IT project management, Database Systems, Systems Analysis & Design, Artificial Intelligence Techniques. OOP (C#), Information Systems, 4IR Technologies, Social practices and Security.

Project Experience

Founder and engineer – Sorae – Saas Platform ***Feb 2026 – present*** | *sorae*

- I designed and built a **financial intelligence** platform that parses bank statements from the **5 major banks** in SA, delivering a full **NCR-aligned affordability report** in **under 3 seconds**, with **95% parsing accuracy,** with fail-safe routing that hard stops unreliable parsers instead of guessing.
- Engineered risk analysis pipeline to surface **15+ risk signals** (payday loans, gambling, chronic deficit, overdraft reliance, income volatility...) directly **cutting vetting times.**
- Developed **RESTAPI** and dashboard workflows with **PDF processing,** enabling integration into lending onboarding, and AI decision layer (**Claude Haiku 4.5**) to translate complex financial data into plain English for non-technical users while ensuring data handled around **POPIA compliance**.

Real-Time Fraud Financial Detection Pipeline – project *Github*

- Built a real time **streaming pipeline** processing financial transactions with a 3-layer **medallion architecture** (Bronze/Silver/Gold) with full **ACID** guarantees via **Delta Lake.**
- Engineered a **fraud feature** extraction using geo distance calculations, **device switch detection** via window functions and **5-minute rolling velocity** metrics per user for future ML scoring setup.
- Implemented **10-minute watermark** for late arrival fault tolerance, schema enforcement, transaction deduplication to ensure an audit ready dataset in the Golden layer.
- Containerised the full project with **Docker Compose** for deterministic ordering (Zookeeper -> Kafka -> Spark) to eliminate cold start condition bettering efficiency. All is visualised with **Streamlit** dashboard.

Work Experience

Full stack developer (Client Project) Omnia Truck and Trailer ***Jul 2025 – Nov 2025***

- Worked in an **Agile** development **team of 5**, to create a production platform to digitise and automate client data capture and quotation workflows throughout onboarding and administrative workflows, reducing manual effort and improving operation efficiency.
- Engineered **MySQL/PHP** backend and integrated an **AI chatbot** grounded on FAQ context to then reduce manual response for staff.

Skills

Software engineering: Python, SQL, TypeScript, Next.js, React.js, SDLC, FastAPI.
Data & AI: ETL Pipelines, Apache Kafka, Spark, Delta Lake, Claude Code, RAG, MCP, Prompt engineering.
Cloud and infrastructure: AWS, Docker, PostgreSQL, CI/CD, RabbitMQ.
Practices: Agile, SDLC, Git, Unit Testing, Integration Testing.
Analysis: Workflow Optimisation, Stakeholder collaboration, regulatory system design.

Certifications

AWS Cloud Practitioner Essentials | IBM Python for Data Science, AI & Development | Meta Programming with Javascript
